

# View a user's Storylines & Posts

Step 1: User is presented with the home page and needs to sign into his/her environment.

Step 2: The user click's the "Sign In" link & signs into the application

Step 3: After being signed in, the user is redirected to their workspace

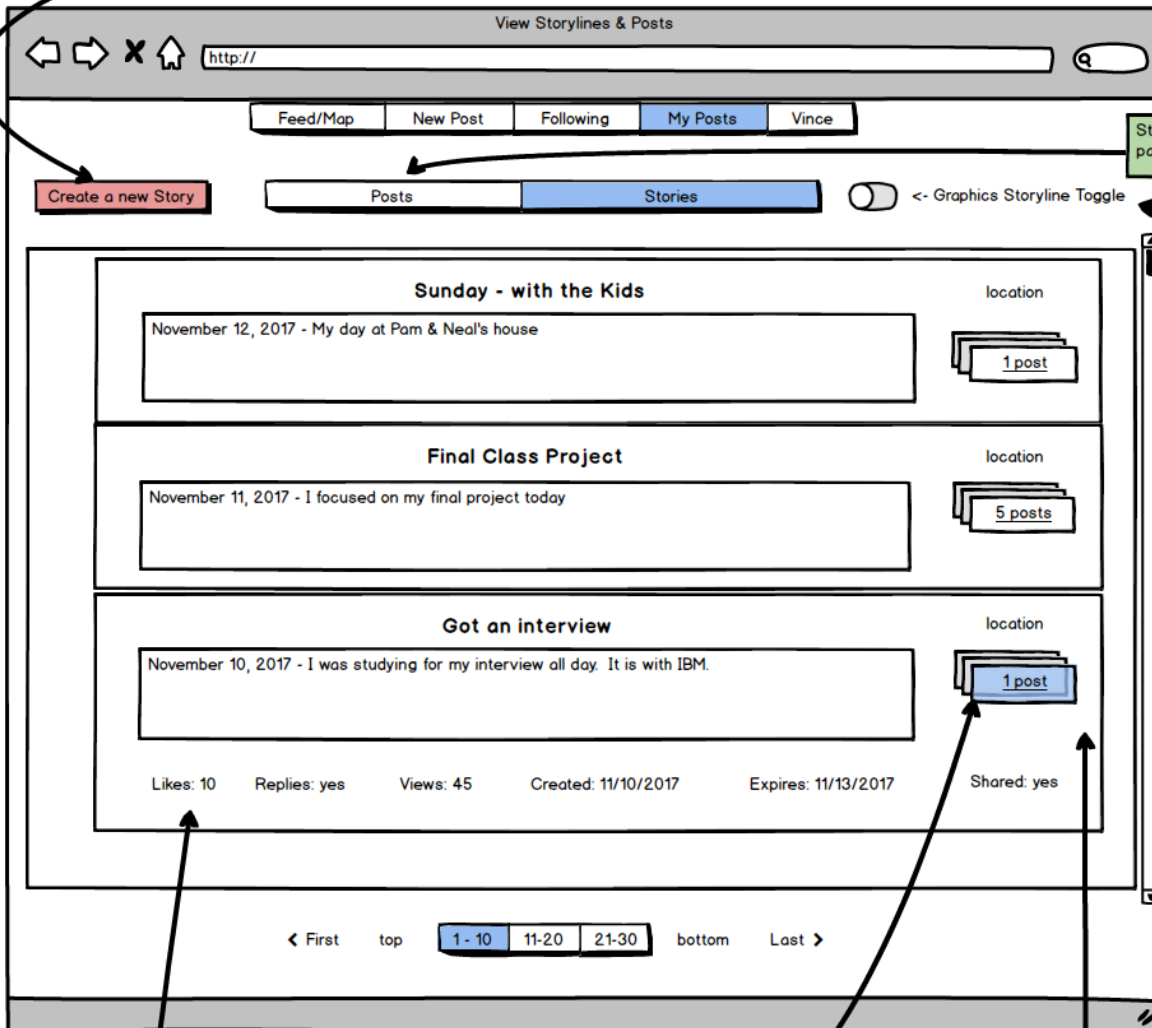

Step 4: My Posts - Posts may or may not associate to a storyline. A toggle allows viewing each in chronological order (newest first). This is where my component starts.....

This component will be developed at some point, and this button will re-direct there.

This button will be omitted if it is decided that to create a storyline, one must first create a post.

I have selected to view the Storylines here

Step 6: View your post that are not part of a story line. See mockup #2

This is the Kaz idea where shared storylines can be displayed as a bubble of varying size depending on activity.

Step #5: The post box will be clickable and will go one level deeper into the storyline. See mock-up #3

This is a storyline detail component within a Storyline list component.

The items in this particular component have not been finalized yet. i am putting them here for illustration.

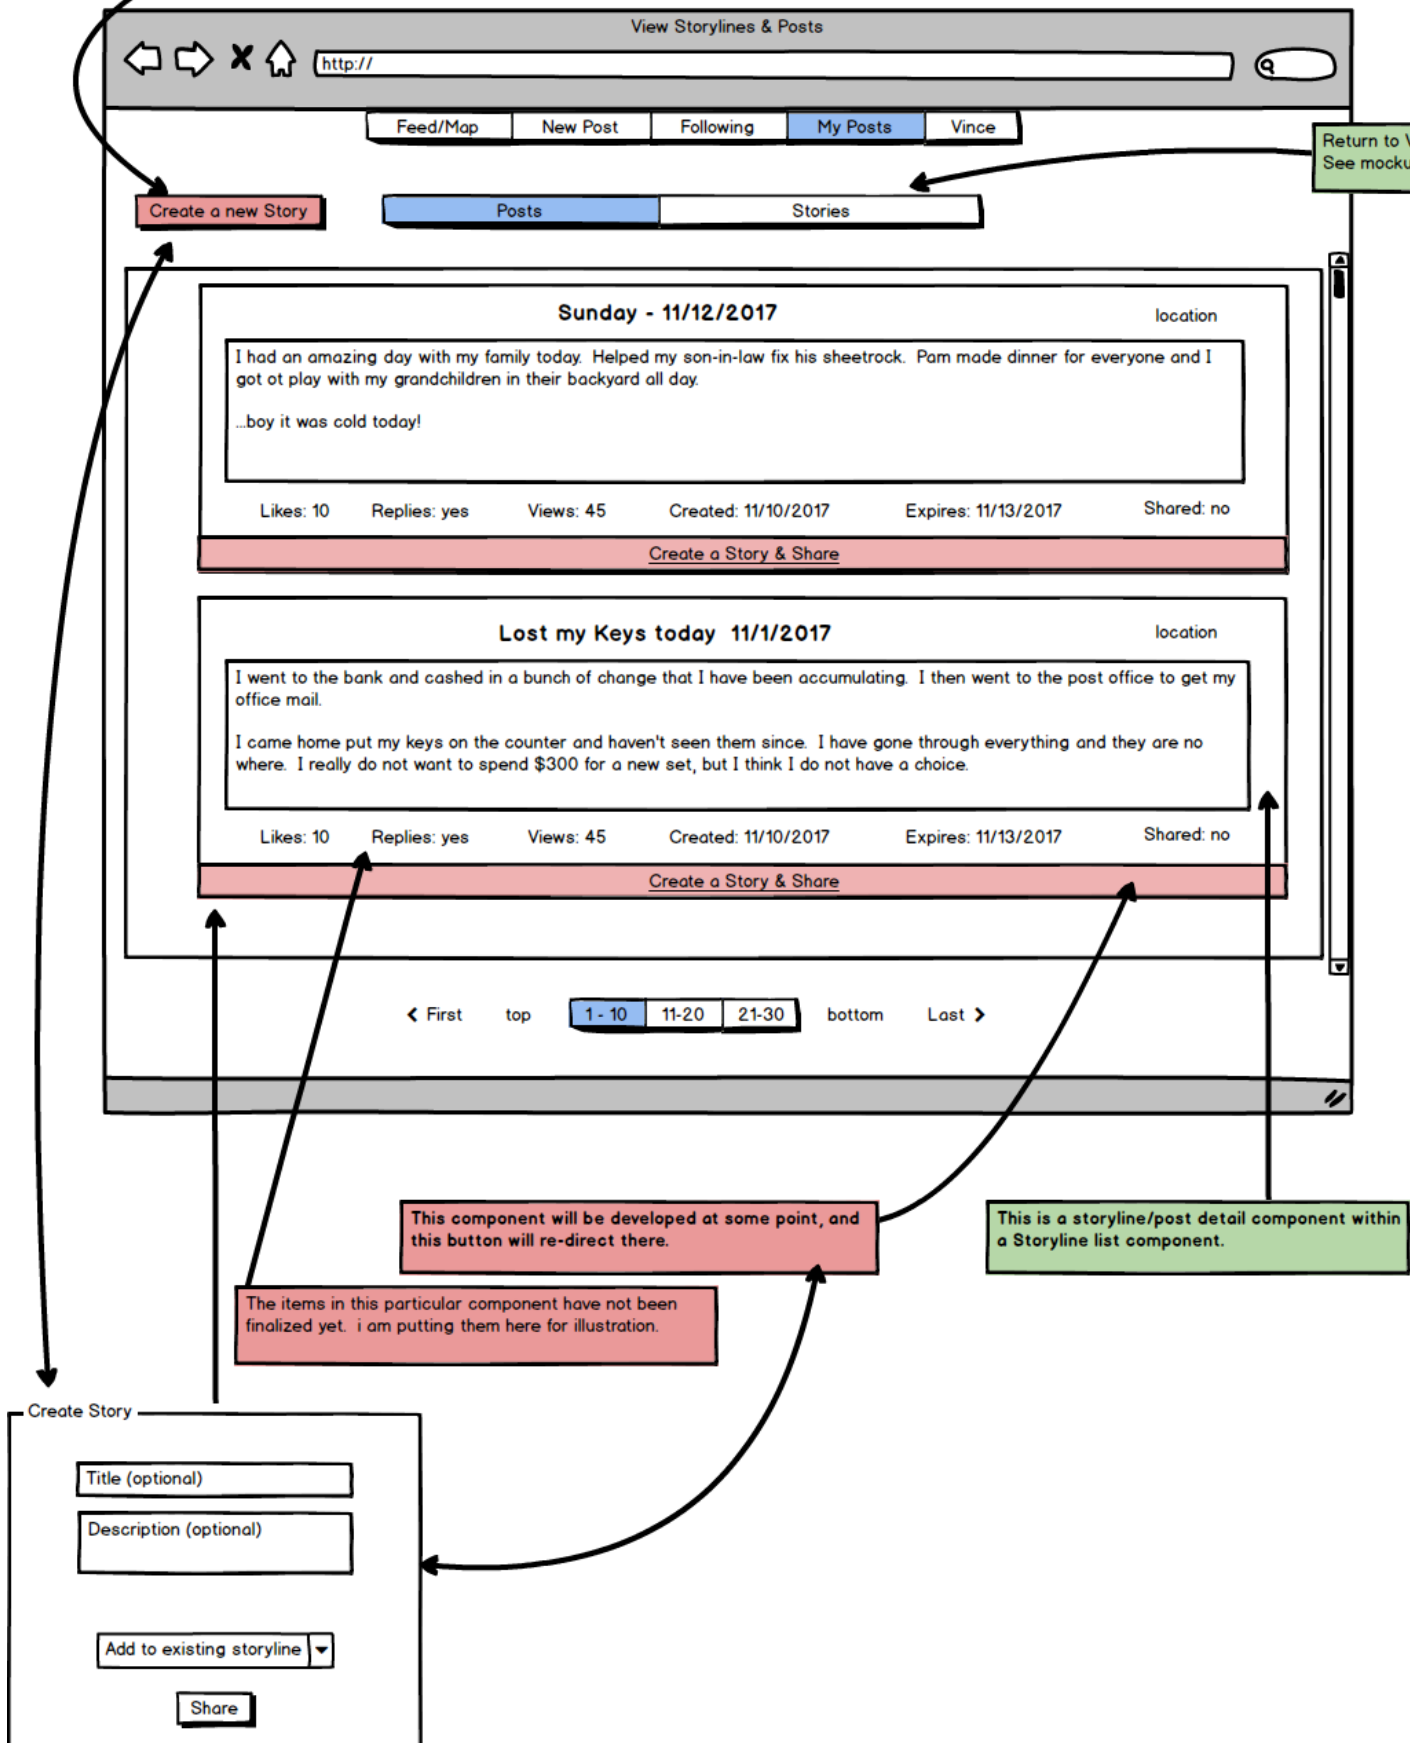

Step 4: My Posts - Posts may or may not associate to a storyline. A toggle allows viewing each in chronological order (newest first). This is where my component starts..... The user has selected the "My Posts" toggle.

This component will be developed at some point, and this button will re-direct there.

This button will be omitted if it is decided that to create a storyline, one must first create a post.

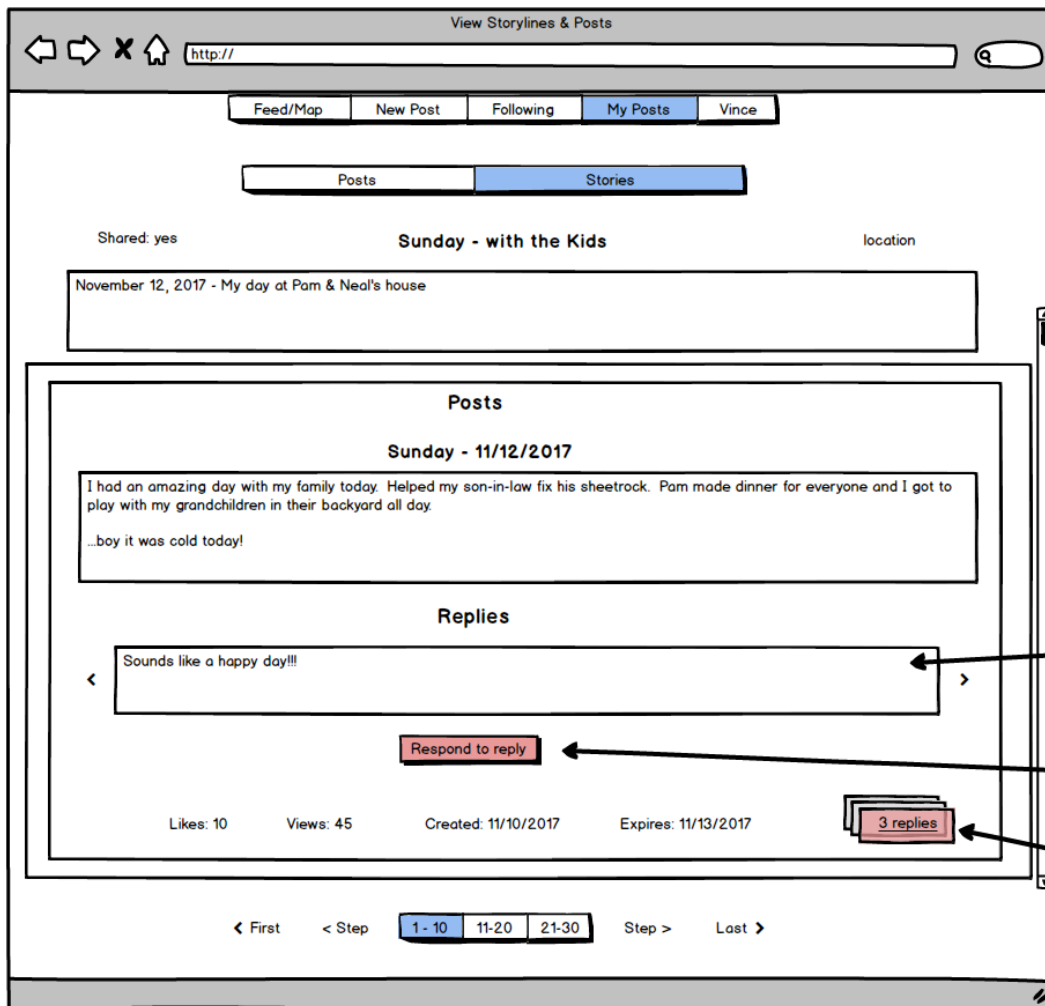

I have selected to view the Posts here

Return to View your "Stories". See mockup #1

Step 4: The User selects a particular storyline and wants to see the posts associated with that line.

I have selected to view the Storylines here

When selected the replies will display below the post & will scroll

This button will re-direct to a componet yet to be developed

Click this button to display the replies

After a lot of thought on how I was going to render things, I feel that a reader of a post can "Reply" 1 time to a particular post and the author of a post can "Respond" 1 time to a "Reply". The chain ends at that point for that post.

Hopefully the story will have more posts added on to it and these 2 users can continue their conversation on the more current posts

Alternatively
